---

Although Austria is surrounded by land and is really hilly topography, meteorological preconditions permit the utilization of wind power. First calculations on the basis of wind measuring data assessed at the meteorological stations in the early 1980s rendered the surprising result of annually approx. 6,600 to 10,000 gigawatt-hour (GWh) of technically exploitable wind energy potential in Austria.

With the increasing expansion of wind power in Austria, this problem of maintaining grid stability is becoming ever greater. However, it is not only the icing of the rotor blades that can lead to ...

Historically, the average for Austria from 1980 to 2023 is 1.85 billion kilowatthours. The minimum value, 0 billion kilowatthours, was reached in 1980 while the maximum of 8.04 billion ...

Although Austria is surrounded by land and is really hilly topography, meteorological preconditions permit the utilization of wind power.
