Static Frequency Converters operate using a double conversion process: a rectifier converts AC to DC, and an inverter converts DC back to AC at the desired frequency.

Inverter speed regulation is achieved by changing the frequency of the power supply to the stator winding of the motor. First, the rectifier section converts the AC power ...

Here's how it works: AC power from the mains is first converted to DC inside the VFD. This DC voltage is then manipulated to create variable-frequency AC output. By adjusting the ...

ABB manufactures a range of frequency converters with features to match the most demanding industrial requirements with flexible inverter based technology allowing seamless connection.
