---

Flywheel Energy Storage Systems (FESS) rely on a mechanical working principle: An electric motor is used to spin a rotor of high inertia up to 20,000-50,000 rpm.

Flywheels are mechanical devices designed to store energy in the form of kinetic energy through the rotation of a mass. When energy is applied to the flywheel, it spins, ...

By capturing energy through the rotation of a flywheel and delivering it quickly when needed, systems based on flywheel energy storage promise long lifetimes, very high ...

Flywheel energy storage systems have gained increased popularity as a method of environmentally friendly energy storage. Fly wheels store energy in mechanical rotational ...
