---

When current is drawn from a fuel cell the voltage decreases below the EMF, the bigger drop, the higher the current density. This voltage drop is often referred to as cell polarisation.

Fuel cells can produce electricity continuously for as long as fuel and oxygen are supplied. The first fuel cells were invented by Sir William Grove in 1838. The first commercial use of fuel cells ...

This page covers key metrics for energy and charge storage in batteries and fuel cells, including theoretical and practical measures of voltage, specific ...

To enhance the active support capability of fuel-cell-powered systems, it is necessary to equip them with appropriate energy storage devices in engineering appl
