Where can LNG be transported?

LNG can also be transported in smaller quantities, by truck, rail, or ship, to locations that do not have natural gas pipeline infrastructure, are not near a port that can receive large LNG tankers, or to small markets on islands or other remote locations.

How much gas does a small scale LNG export take?

To meet the demands of the small scale LNG market, in July 2018, DOE issued a rule that expedites the permitting of small scale exports of U.S. natural gas (less than 0.14 billion cubic feet per day or 51.75 billion cubic feet or 1 tonne per year.)

How do you transport natural gas?

Transporting natural gas via road or rail, or alternatively using natural gas to power vehicles provide additional transportation options for natural gas, typically for shorter distances. Compressed natural gas (CNG) can be used to fuel natural gas vehicles like buses, trucks, and cars.

For this problem, we propose bi-objective mixed-integer linear programming (MILP) models aiming at minimizing the makespan and the total energy consumption simultaneously. ...
