Are green cellular base stations sustainable?

This study presents an overview of sustainable and green cellular base stations (BSs), which account for most of the energy consumed in cellular networks. We review the architecture of the BS and the power consumption model, and then summarize the trends in green cellular network research over the past decade.

What is a cellular base station?

A cell site, cell phone tower, cell base tower, or cellular base station is a cellular -enabled mobile device site where antennas and electronic communications equipment are placed (typically on a radio mast, tower, or other raised structure) to create a cell, or adjacent cells, in a cellular network.

How many types of base stations are there?

Macro cell, Micro cell, Pico cell and Femto cell are 4 types of base stations in wireless communication networks. Macrocell antennas must be properly mounted on ground-based masts, rooftops or other existing structures and at heights for an unhindered, clear view of the surroundings.

What is a base station?

Base stations are one of the widely used components in the field of wireless communication and networks. It is an access point or base point of a particular area for network accessibility. In this article, we will discuss the different types of base stations with their advantages and applications in the real world.

We review the architecture of the BS and the power consumption model, and then summarize the trends in green cellular network research over the past decade.

This article explains the definition, structure, types, and principles of base stations, while highlighting the critical role of thermal interface materials in base station heat ...

This article explains the definition, structure, types, and principles of base stations, while highlighting the critical role of thermal ...

A wide range of techniques and technologies are covered in this review article that focuses on innovative strategies, network architectures, and energy-efficient wireless ...
