Sodium-ion batteries (SIBs) are considered one of the most promising alternatives to LIBs in the field of stationary battery storage, as ...

These batteries typically operate at room temperature and employ a transition metal cathode, a non-selective, electrically insulating porous polymer separator, a carbon or a titanate anode, ...

As researchers work to find materials for the next generation of batteries for energy storage, sodium metal (Na) and sodium ions have become a focus. But there are many ...

Considerable international effort is being directed into the development of high-performance electrode materials for Na-ion batteries, which are crucial to their growth.
